J. SEMITON: Receptor for the MCP-1 (JE), MCP-3 (FIC) and MCP-5

Calcium ions level.

J. SEMILARITY: Detected in monocyte/macrophage cell lines,
but not in nonhematopoietic cell lines.

J. SIMILARITY: Belongs to family 1 of G-protein coupled receptors.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        SEQUENCE FROM N.A.

Hum. Retroviruses 17:981-986 (2001).

-!- FUNCTION: Receptor for the chemokines SCYA1/I-309, SCYA4/MID-1-beta and SCYA1/TARC. May regulate monocyte chemotaxis and thymic call line apoptosis (By similarity).

-!- SUBCELLUIAR LOCATION: Integral membrane protein.

-!- SIMILARITY: Belongs to family 1 of G-protein coupled receptors.
                                                                                                                                                                                                                                                              Gaps

AIDS Res. Hum. Retroviruses 17:981-986(2001).
-!- FUNCTION: Receptor for the MCP-1, MCP-3 and MCP-4 chemokines.
Transduces a signal by increasing the intracellular calcium ions
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            16-OCT-2001 (Rel. 40, Created)

Cc Chemokine receptor.3: blockade using a monoclonal anticody in vivo "; Jummunol. 161:6139-6147(1998).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             -I. FUNCTION: Receptor for a C-C type chemokine. Binds to ectaxin, MCP-3, MCP-4 and RANTES and subsequently transduces a signal by increasing the intracellular calcium ions level (By similarity).
-I. SUBCELLULAR LOCATION: Integral membrane protein.
-I. SIMILARITY: Belongs to family 1 of G-protein coupled receptors.
                                                                                                                                                                                                                                                 CKR3 CAVPO STANDARD; PRT; 358 AA.

-1- TISSUE SPECIFICITY: Detected in the heart, spleen, lung, peritoneal exudate cells and leukocytes.
-1- SIMILARITY: Belongs to family 1 of G-protein coupled receptors.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              CKR3 RAT STANDARD; PRT; 359 AA.

Harrington P.M., Mewton D.J., Coleman J.W., Flanagan B.F.;
Submitted (JAN-1998) to the EMEL/GenBank/DDBJ databases.
-!- FUNCTION: Receptor for a C-C type chemokine. Binds to ectaxin,
MCP-3, MCP-4 and RANTES and subsequently transduces a signal by
increasing the intracellular calcium ions level (By similarity).
-!- SUBCELLULAR LOCATION: Integral membrane protein.
-!- TISSUE SPECIFICITY: Expressed in spleen but not in astrocytes or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps
                                                                                                                                                                                                                                                                                                                                             -!- SIMILARITY: Belongs to family 1 of G-protein coupled receptors.

C-C chemokine receptor type 4 (C-C CKR-4) (CCR-4) (CCR4)
                                                                                                                                           -i-FUNCTION: Receptor for the C-X-C chemokine CXCL16. Used as a coreceptor by SIVs and by strains of HIV-2 and m-tropic HIV-1.
-i-SUBCELLULAR LOCATION: Integral membrane protein.
-i-SIMILARITY: Belongs to family 1 of G-protein coupled receptors.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            CCR4 OR CMKBR4.

Inngjerdingen M., Damaj B., Maghazachi A.A.;

Innmunon K. Cells express CC chemokine receptors 4 and 8 and respond to require the express CC chemokine, macrophage-derived and 1-309 ";

Inmunon Infation-regulated chemokine, macrophage-derived themokine, and 1-309 ";

Inmunon Infation receptor for the C-C type chemokines

TARC/SCYA17 and MDC/SCYA22. The activity of this receptor is mediated by Gil proteins which activate a phosphatidylnositol-calcium second messenger system. Can function as a chemoatractant carried by Gil proteins which activate a phosphatidylnositol-calcium second messenger system. Can function as a chemoatractant carried by primary HIV-2 isolates. In the CNS, could mediate hippocampal-neuron survival.

C-I- SUBCELLULAR LOCATION: Integral membrane protein.

C-I- SUBCELLULAR LOCATION: Integral membrane protein.

C-I- TISSUE SPECIFICITY: Predominantly expressed in the thymus, in peripheral blood Leukocytes, including T cells, moselly the and basophils, and in platelets; at lower levels, in the spleen and basophils, and in platelets; at lower levels, in the spleen and basophils, and in platelets; at lower levels, including memory T cells, moselly the ones expressing the cutaneous lymphocyte antigen (CLA). Expressed in brain microvascular and coronary artery endothelial cells.

Human chemokine receptor; CD4; HIV; glycoprotein 120; gp120; antagonist; replication; CCR5; CXCR4; CD4; STRL33. (USSH) US DEPT HEALTH & HUMAN SERVICES. HIV gp120 protein binding peptide #47. Ş AAB88954 standard; peptide; 18 25-AUG-2000; 2000WO-US023505. 99US-0151270P. (first entry) WPI; 2001-244398/25 WO200116182-A2. 27-AUG-1999; Homo sapiens. 23-MAY-2001 08-MAR-2001. Saxinger C;

Novel polypeptides useful for treating HIV infection, have homology to regions of domains of human chemokine receptors CCR5, CXCR4 and STRL33, and binds to HIV gpl20 under physiological conditions.

Example 1; Page 37; 114pp; English.

The present invention describes a number of peptides which are able to bind to HIV glycoprotein 120 (gp120). These are similar to the human chemokine receptors CCR5, CXCR4 and STR133, as well as CD4. These are useful in the treatment of HIV, as they prevent replication of the virus. The present sequence is an example of a peptide of the invention

                                                                                                                                                                                                                                                                                   The present sequence is human CC (Cys-Cys) chemokine receptor 5 (CCR5), which is estimulated by MIP-1 alpha, MIP-1 beta or RANTES chemokines, but not by monocyte chemoattractant protein 1 (MCP-1), MCP-2, MCP-3, interleukin-8 (IL-8) or growth related gene product alpha (GRO alpha) chemokines, Active CCR-5 is also a receptor of human immunodeficiaency virus type 1 or type 2 (HIV-1 or HIV-2). CCR5 or its CDNA can used to diagnose, treat and/or prevent inflammatory diseases, e.g. rheumatoid psoriaeis, iral infections, especially HIV-1 or HIV-2 infection, cancer, atherosclerosis and autoimmune disorders
                                                                                                                                                                                                         Active and inactive forms of human CC chemokine receptor CCR-5 - useful to diagnose, prevent and/or treat inflammatory disorders, autoimmune disease and viral infection.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        This polypeptide sequence comprises novel human chemokine receptor 88C, a grotein coupled receptor that is involved in leukcoyte trafficking. Its amno sequence was deduced from a cDNA clone (AAAT85161) isolated from a macrophage library. Its shows 62% identity to CCCKR1. Chemokine receptor 88-2B (see AAW27124) has also been identified. 88C and 88-2B receptors and their polypeptide fragments can be produced in transformed host cells. The receptors, peptides comprising one or more of the extracellular or intracellular domains, and anti-receptor antibodies can be used to modulate receptor activities, particularly ligand and G protein binding, and are potentially potentially useful in the treatment of atheroslerosis, inheumatoid arthritis, tumours, asthma, viral
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              G-protein chemokine receptor; HDGNR10; signal transduction;

                                                                                                                                                                                                                                                                                                                                                    Novel human mature G-protein chemokine receptor HDGNR10 (AAW07602) is a 7-transmembrane protein involved in signal transduction. Its amino acid sequence was deduced from a cDNA clone (AAT44042) isolated from a human monceyte library. Isolation of the cDNA allows prodn. of recombinant HDGNR10 in host, e.g. E. coli, COS or Sf9, cells. The recombinant creeptor can be used to identify agonists or antagonists of the receptor; such cpds. can be used to identify agonists or antagonists of the receptor; expression of G-protein chemokine receptors
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         CC chemokine receptor 5; CCR5; G-protein coupled receptor;
human immunodeficiency virus; HIV; CD4; AIDS; therapy; transgenic animal.
                                                                                                                                                                                    Human G-protein chemokine receptor, HDGNR10 - useful to identify (ant)agonists, for treatment of haematopoiesis, leukaemia, chronic and acute inflammation, rheumatoid arthritis, etc.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ;

This is the amino acid sequence of wild-type human CCR5, which serves as a co-receptor for infection by macrophage-tropic (M-tropic) strains of HIV-1. The invention relates to the identification of a CCR5 variant (see AW88211), designated CCR5m303, comprising the first two transmembrane domains of wild-type CCR5, but lacking transmembrane domains of wild-type CCR5, but lacking transmembrane domains of the CCR5m303 variant with the wild type CCR5 allele shows a positive correlation with resistance to infection with M-tropic HIV-1 carains, and may indicate slower progression of the disease. The detection of CCR5 variants may be used to identify individuals at lower crisk of infection relative to the general population who, if infected, may exhibit slower progression to ALDS. Probes and primers (see ANV84127-36) are provided for use in diagnostic methods for detecting the presence of such variants. A method is provided for inhibiting HIV-1 infection of a cell expressing the CCR5 receptor. This involves introducing a nucleic acid encoding a CCR5 variant into the cell, thereby reducing the number of functional CCR5 molecules present on the cell surface
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Human; G-protein coupled receptor; G-protein chemokine receptor; HDGNR10;
                                                                                                                                                                                                                                                                                                                                                                                                                                                   New CCRS variant protein of the HIV-1 co-receptor - useful in developing resistance of CCRS-expressing cells to {
m HIV-1} infection.
        /note= "corresponds to TGT (Cys) in wild-type CCR5, (Stop) in CCr5m303"
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             g
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ö
                                                                                                                                                                                                                                                                                                                                                                                                                      This protein sequence comprises of a novel human macrophage-selective CC chemokine receptor that has been designated CCR5. The sequence was deduced from an isolated DNA clone (see APT/620). An Ala127Leu variant (see WA38810 of CCR5 as a slow identified. The susceptibility of human macrophages to HIV infection depends on cell surface expression of CD4 protein coupled cell surface molecules. The susceptibility of for protein coupled cell surface molecules. It plays an essential role in the membrane fusion step of infection by some HIV isolates. The establishment of stable, non-human cell lines and transgenic mammals having cells that coexpress human CD4 and CCR5 provides valuable tools for research of HIV infection. Antibodies that bind to CCR5, CCR5 variants, and CCR5-binding agents capable of blocking membrane fusion between HIV and target cells represent potential anti-HIV therapeutics for macrophage tropic strains
                                                                                                                                                                                                                                                                                                                                              CC chemokine receptor 5 polypeptide - used to inhibit membrane fusion
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            HIV-1; CCR5; CCR5m303; co-receptor; infection; diagnosis; AIDS;

The present sequence represents a human G-protein chemokine receptor designated HDGNR10 polymucleotides are useful in methods of screening for compounds which bind to and either: (1) activate the HDGNR10 polypeprides causing stimulation of haematopoiesis, wound healing, coagulation, and angiogenesis; treatment of solid tumours, chronic infections, leukaemia, T-cell mediated autoimmune diseases, parastic infections, psoriasis, and to stimulate growth factor activity, or (2) inhibit activation of the HDGNR10 polypeptides which is useful for preventing and/or treating allergy, atherogenesis, anaphylaxis, malignancy, chronic and acute inflammation, histamine and immunoglobulin B-mediated allergic reactions, prostaglandin-independent fever, bone marrow failure, silicosis, sarcoidosis, rheumatois arbhits shock and hyper-eosinophilia syndrome. The polymucleotides are also useful for diagnostic assays for detecting the polypeptides and for detecting an nucleic acid sequences encoding the polypeptides and for detecting an altered level of the soluble form of the receptor polypeptides. The polymucleotides are also useful for in vituro purposes related to micro polymolectics securicity for in vituro purposes related to scientific research, synthesis of DNA and manufacture of DNA vectors
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Human, receptor; DC-SIGN, dendritic cell; T lymphocyte; HIV; gpl20;

                                                                                                                                                                                                                                                                                                                                                                                                                             The specification describes an antibody which is specific for an antigenic fragment of gp120. This antigenic fragment binds to DC-SIGN or is exposed upon gp120 binding of DC-SIGN due to concomitant conformational change. DG-SIGN is a receptor that is specifically expressed on dendritic cells and facilitates infection of T lymphocytes with HIV. DC-SIGN is identical to a HIV-1 gp120-binding C-type lectin. DC-SIGN is identical to a HIV-1 gp120-binding C-type lectin. DC-SIGN binds ICAM-3 (which is expressed constitutively on T lymphocytes) with high affinity. The antibody of the invention inhibits the trans enhancement of HIV entry into a T cell or macrophage facilitated by dendritic cells. The antibody is useful to treat or prevent HIV infection. The present sequence represents a human CCRS protein, which is a translocation promoting agent that interacts with CD4. This receptor functions in HIV-1 entry into cells
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Human; G-protein chemokine receptor; CCR5; HDGNR10; inflammation; HIV; human immunodeficiency virus; antimicrobial; vasodilator; vulnerary; yctostatic; immunosuppressive; nootropic; neuroprotective; gene therapy; neurodegenerative disorder; Kaposi's sarcona; autoimmune disease; rheumatoid arthritis; cancer; breast; ovary; adrenal gland; bone marrow; gastrointestinal tract; lung; liver; immune disorder; Addison's disease; haemolytic anaemia; autoimmune thyroiditis; diabetes mellitus; allergy; multiple sclerosis; ulcerative collitis; Crohn's disease; wound healing; cardiovascular disorder; myocardial ischaemia.
                                                                                                                                                                                                                                                                                                                   An antibody for the treatment or prevention of HIV-infection comprises a gpl20 portion which binds to DC-SIGN or is exposed upon gpl20 binding of DC-SIGN due to concomitant conformational change.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ;

The invention relates to human G-protein chemokine receptor (CCR5) HDGNR10 polypeptides and polymuclectides. CCR5 HDGNR10 antibodies are useful for treating, preventing or ameliorating a disease or disorder associated with inflammation, defective or aberrant chemotaxis of immune cells, HIV infection (such as Pheumocystis carini; pneumonia or Kaposi's sarcoma) or defective or aberrant T-cell antigen presenting cell interaction. The disease or disorder may also be an infections disease (e.g. a viral infection such as an early stage HIV infection, a cytomegalovirus infection, or a poxvirus infection), an autoimmune disease (e.g. rheumatoid arthritis) or a neurodegenerative disorder. The disease or disorder may be associated with aberrant CCR5 expression, lack

of CCR5 function, aberrant CCR5 ligand expression, or lack of CCR5 ligand function. CCR5 HDGNR10 protein is used as a food additive or preservative to increase or decrease storage capabilities. CCR5 HDGNR10 DNA are useful for chromosome identification and in gene therapy. CCR5 HDGNR10 DNA, protein, antibodies, agonists and antagonists are also useful in the diagnosis, treatment and prevention of cancer (breast, ovary, adrenal gland, bone, bone marrow, gastrointestinal tract, liver, lung, urogenital); immune disorders (Addison's disease, allergies, autoimmune haemolytic anaemia, autoimmune thyroiditis, diabetes mellitus, Crohn's histosa, multiple sclerosis, rheumatoid arthritis and ulcerative colitis); cardiovascular disorders (Mpocardial ischaemias) and wound healing. The present sequence is human CCR5 HDGNR10 protein
                                                                                                                                                                                                                                                                                                                                                   ö

Diagnostic agent containing two or more receptor-specific ligands, useful for detecring tumors, inflammation etc., also therapeutic use of ligand inhibitors.

Disclosure, Page 10; 26pp; German.

at least in This invention describes a novel diagnostic agent (A) comprising two different ligands (I) for receptors (II) that are implicated

or prostatic), organ rejection, inflammation and autoimmune diseases.
Also inhibitors of (I) are used therapeutically against tumors (and their metastases), inflammation (particularly bronchial asthma or chronic bowell inflammation), or autoimmune diseases (rheumatcoid arthritis or lupus), where the (cardio) vascular, lymphatic, respiratory, nervous, digestive, endocrine, motor or urogenital systems or skin are affected, and bone marrow diseases. The products of the invention are chemokine derivatives which have cytostatic, antiinflammatory, antisthmatic, chemokine derivatives immunosuppressive, dermatological, antitheumatic, antiarthritic. Chemokines act on specific tumor and inflammatory cells through a conscellation of chemokine receptors (CR), which control migration and proliferation of these cells. AAG80045 AAG80128 represent human chemokine (A) are used for the diagnosis of tumors (especially colorectal fragments used to illustrate the method of the invention 888888888888888888888

Disclosure; Col 47-50; 37pp; English.

The present invention relates to a transformed mammalian cell that contains a gene encoding CD4, a construct encoding a reporter gene under the regulation of an human immuno deficiency virus (HIV) long terminal repeat (LTR) and that has been transduced with a vector encoding a human chemokine receptor (CKR) where the CD4 and the CKR are present on the cell surface of transformed mammalian cell. The invention is useful for

The present sequence is human G-protein chemokine receptor (CCRS) HDGNR10 protein. CCRS HDGNR10 cDNA is included in ATCC Deposit No: 97183. CCR5 HDGNR10 antibodies are useful for treating, preventing or amaliorating a disease or disorder associated with inflammation, defective or aberrant chemotaxis of immune cells, HTV infection (such as Pneumocystis carini premotaxis of immune cells. HTV infection (such as Pneumocystis carini presenting cell interaction. The disease or disorder may also be an infectious disease (e.g. a viral infection such as an early stage HIV infection, a cytomegalovirus infection, or a poxvirus infection, an automane disease (e.g. rheumatoid arthritis) or a neurodegenerative containmune disease or disorder may be associated with aberrant CCRS disorder. The disease or disorder may be associated with aberrant CCRS cxpression, lack of CCRS function. CCRS HDGNR10 protein is used as a food additive or preservative to increase or decrease storage capabilities. CCRS HDGNR10 DNA are useful for chromosome identification and in gene conternation or such an early adrenal gland, bone, bone marrow, gastrointestinal tract, breast, ovary, adrenal gland, bone, bone marrow, gastrointestinal tract, cubic mune haemolytic anaemia, autoimmune thyroiditis, diabetes mellitus, collitis), cardiovascular disorders (Mayocardial ischaemias) and wound colling collitis).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Isolated nucleic acid encoding a human G-protein chemokine receptor (CCRS) HDGNR10 polypeptide, useful for preventing or treating autoimmune diseases e.g. rheumatoid arthritis, hyperproliferative disorders and neurodegenerative disorders.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          100.0%; Score 96; DB 4; Length 352; 100.0%; Pred. Isolated nucleic acid encoding a human G-protein chemokine receptor (CCRS) HDGNRIO polypeptide, useful for preventing or treating autoimmune diseases e.g. rheumatoid arthritis, hyperproliferative disorders and neurodegenerative disorders.

Example 40; Page 486-487; 495pp; English.

The present sequence is human d-protein chemokine receptor (CCR5) HDGNR10

C protein. CCR5 HDGNR10 antibodies are useful for treating, preventing or
ameliorating a disease or disorder associated with inflammation,

C defective or aberrant chemotaxis of immune cells, HTV infection (such as
C decrein antigen presenting cell interaction. The disease or
C disorder may also be an infectious disease (e.g. a viral infection such
cs an early stage HIV infection, a dytomegalovirus infection, or a
CC disorder may also be an infection, a dytomegalovirus infection, or a
CC disorder may also be an intection, a dytomegalovirus infection, or a
CC disorder may also be an intection, a dytomegalovirus infection, or a
CC disorder may be associated
CC a neurodegenerative disorder. The disease or disorder may be associated
CC with aberrant CCR5 expression, lack of CCR5 function, aberrant CCR5
CC ligand expression, or lack of CCR5 ligand function. CCR5 HDGNR10 protein
CC is used as a food additive or preservative to increase or decrease
CC storage capabilities. CCR5 HDGNR10 DNA are useful for chromosome
CC identification and in gene therapy. CCR5 HDGNR10 DNA, protein,
CC antibodies, agonists and antagonists are also useful in the diagnosis,
CC treatment and prevention of cancer (breast, ovary, adrenal gland, bone,
CC disorders (Addison's disease, allergies, autoimmune haemolytic anaemia,
CC disorders (Addison's disease, allergies, autoimmune haemolytic anaemia,
CC disorders (myocardial ischaemias) and wound healing

New human G-protein chemokine receptor polypeptides and polynucleotides, useful for identifying (ant)agonists to the G-protein chemokine receptor

Claim 1a; Page 15; 22pp; English.

This invention describes a novel receptor polypeptide (1) selected from (1) a fully defined 329 amino acid sequence (II) fully disclosed in the specification, and (ii) a polypeptide encoded by the DNA contained in a plasmid, and fragments, analogs and derivatives of the polypeptide. The products of the invention have antiinflammatory, immunomodulatory, anticoagulant, antiallergic, immunosupressive, vulnerary, cytostatic, antiparastitic, antipocriatic, antiinflammatory, immunomodulatory, continged can be used for gene therapy. The d-protein chemokine activity and can be used for gene therapy. The d-products of the invention can also be used for stimulating haematopoiesis, wound healing, coagulation, and operation of the invention of activate or inhibit activation of (1). The products of the invention can also be used for stimulating haematopoiesis, wound healing, coagulation, and operation of activity and can be used for stimulating solid tumours, chronic infections, psoriasis, and stimulating growth factor activity. HDGNRIO is useful for treating stimulating growth factor activity. HDGNRIO is useful for treating stimulating arowth factor activity. HDGNRIO is useful for treating callergy, atherogenesis, anaphylaxis, malignancy, chronic and acute inflammation, histamine and immunoglobulin B (IgB)-mediated allergic reactions, prostaglandin-independent fever, bone marrow fallure, cosinophilic syndrome. Sequence 352 AA;

```
This sequence represents the human CCRS protein sequence. The invention relates to a method for determining whether an agent is capable of modulating the interaction of chemotractic chemokine receptor 5 (CCR5) with gpl20, comprising incubating the agent with CCRS and gpl20 and determining whether the agent modulates the interaction, where gpl20 as sociated with CD4, and where the interaction is a low affinity binding. The method is used to identify an agent capable of modulating the interaction of CCRS with gpl20, an agent identified by the method is used to prepare a pharmaceutical composition for the treatment of a disease or condition associated with CCRS and gpl20 interaction, to treat a subject with a disease or condition associated with CCRS and gpl20 interaction, and for preparing a pharmaceutical for treating human immunodeficiency virus (HIV). It can also be treat anti-inflammatory diseases. The method is commercially useful, amenable to high throughput screening, and cetects interaction of gpl20 with cells expressing only CCR5.
                                                                                                                                                                                                                                                                                                                                                                                                                Determining if an agent can modulate CCR5-gp120 interaction, comprises incubating the agent with CCR5 and gp120 and determining if the agent modulates the interaction.
                                       Chemotactic chemokine receptor 5; gp120; CD4; therapy; HIV; CCR5; human immunodeficiency virus; anti-inflammatory disease; human.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            AAB82948 standard; protein; 352 AA.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Identifying agonists of G protein-coupled receptors (GPCRs) for use in disease treatment, comprises contacting candidate compounds with versions of GPCRs.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The invention relates to G protein-coupled receptors (GPCRs) for which the endogenous ligand has been identified. Non-endogenous constitutively activated versions of known GPCRs are used in the invention for the direct identification of candidate compounds as receptor agonists, inverse agonists or partial agonists. Such agonists are useful as therapeutic agents for diseases or disorders associated with GPCRs. The present sequence is a non-endogenous version of a known human GPCR
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps

The present sequence is that of human HIV-1 co-receptor CCR5. Amino acids 2-18 in the N-terminal region of CCR5 comprise an HIV-1 gpl20-binding 2-18 in the N-terminal region of CCR5 comprise an HIV-1 gpl20-binding 2.18 HIV-1 gpl20. Post-translational sulfation of the interaction between CCR5 and HIV-1 gpl20. Post-translational sulfation of the tyrosine residues in the CCR5 N-terminal is required for gpl20 binding and may critically modulate the susceptibility of target cells to HIV-1 infection in vivo. The invention provides claimed sulfated peptides (see AAB8294) that are based on the CCR5 N-terminal region and which are effective for inhibiting HIV-1 binding to CCR5. These oppides are used in claimed methods of inhibiting HIV infection of CD4+ cells, of preventing CD4+ cells are infected with HIV, of treating a subject, whose CD4+ cells are infected with HIV, and of identifying an agent which inhibits binding of a CCR5 ligand to a CCR5 receptor. The methods may be carried out in a subject, especially a human, infected (therapeutic method), not infected with, but has been exposed to, HIV
                                                                                                                                                                                                                                                                                                                                                                                                                                                 Novel compounds comprising specific amino acids within CCR5 (HIV 1 coreceptor) amino terminal domain including negatively charged and two sulfated tyrosine residues is useful for treating HIV infection in

The present invention relates to the isolation of a novel human G-protein chemokine receptor (CCR5) designated HDGNR10, and polynucleotide sequences encoding it. The invention also describes antibodies that bind human G-protein chemokine receptor (CCR5) HDGNR10 and polynucleotide chuman G-protein chemokine receptor (CCR5) HDGNR10 and polynucleotide sequences encoding the antibodies. The antibodies are useful for treating or preventing inflammation, defective or aberrant chemotaxis of immune cells and T-cell/antigen-presenting cell interactions, infections and autoimmune diseases, rheumatoid arthritis, neurodegeneration, viral infections depecially early-scage human immune deficiency virus (HIV), cytomegalovirus or pox virus infections, Kapoei sarcoma, or conditions associated with aberrant or deficient expression of the CCR5 receptor or its ligands. The antibodies are also useful to determine CCR5 expression, e.g. for diagnosis, prognosis and monitoring of accer and other combinant receptor, and in the treatment of a wide range of diseases such as infectious diseases (e.g. influenza), neurological diseases (e.g. combinant requence represents human G-protein chemokine receptor (CCR5) HDGNR10 er ecceptor (CCR5) HDGNR10 #10.

Parkinson's diseases (e.g. influenza), neurological diseases (e.g. HDGNR10 #1)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                       New nucleic acid encoding an antibody specific for the G-protein chemokine receptor CCR5, useful for treatment and diagnosis of e.g. inflammation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Human, G-protein chemokine receptor, CCR5, HDGNR10, inflammation, immune cell chemotaxis, autoimmune disease, rheumatoid arthritis, neurodegeneration, viral infection, Kaposi sarcoma, cancer,

        XXXX
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              8
                                                                                                                                                                                                                                                                                                                                                                                         The present invention relates to the isolation of a novel human G-protein chemokine receptor (CCRS) designated HDGNR10, and polymucleotide sequences encoding it. The invention also describes antibodies that bind human G-protein chemokine receptor (CCRS) HDGNR10 and polymucleotide bind human G-protein chemokine receptor (CCRS) HDGNR10 and polymucleotide sequences encoding the antibodies. The artibodies are useful for treating cells and T-cell/antigen-presenting cell interactions, infections and autonomium diseases, rheumatoid arthritis, neurodegeneration, viral infections (especially early-stage human immune deficiency virus (HIV), cytomegalovirus or pox virus infections, Kaposi sarcoma, or conditions associated with abertrant or deficient expression of the CCRS receptor or its ligands. The antibodies are also useful to determine CCRS exceptor or its ligands. The antibodies are also useful to determine CCRS exceptor or its ligands. The diseases The polymucleotide sequences encoding human crombinant receptor, and in the treatment of a wide range of diseases rough a sinfectious diseases (e.g. intluenza), neurological diseases (e.g. parkinson's diseases), and hyperproliferative disorders (e.g. cancer). The invention relates to a method for identifying a binding compound for chemokine receptor 5 (CCR5). The method involves screening a library of test molecules (particularly peptides) with immobilised CCR5, and then identifying those molecules which bind. The invention also relates to identifying those molecules which bind. The invention also relates to complete a identifying consensus motifs for CCR5-binding peptides, a transfer vector encoding tagged CCR5, a computer-aided methods for transfer vector encoding tagged CCR5, a computer-aided methods for a computer aided drug screening assay that utilises the three-dimensional structure of CCR5. Compounds identified using the methods of the invention are useful for treating or preventing HJV (human structure of CCR5. Compounds identified using the methods of the invention may also be used to invention in a patient. The methods of the interaction of CCR5. The present containing and the interaction of CCR5. The present sequence represents a naturally courring variant of human CCR5. The present sequence represents a naturally a leucine, at position 55 the invention 55 there is a glutamine, rather than a leucine, at position 55
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Identifying CC chemokine receptor 5 binding compound for treating AIDS, comprises binding a molecule from library to a molecule having binding property corresponding to CCRS and identifying bound molecule.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The invention relates to a method for identifying a binding compound for CC chemokine receptor 5 (CCR5). The method involves screening a library CC chemokine receptor 5 (CCR5). The method involves screening a library of test molecules (particularly peptides) with immobilised CCR5, and then identifying those molecules which bind. The invention also relates to CCR5-binding molecules identified using the method of the invention, methods for identifying consensus motifs for CCR5-binding peptides, a transfer vector encoding tagged CCR5, a computer-aided methods for determining that relative binding affinity of a test molecule to CCR5 and a computer aided drug screening assay that utilises the three-dimensional structure of CCR5. Compounds identified using the methods of the invention are useful for treating or preventing HIV (human immunodeficiency virus) infection or AIDS (acquired immunodeficiency syndrome) in a patient. The methods of the invention may also be used to identify agonists or antagonists of the interaction of CCR5. The present sequence represents human CCR5.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ö

leukemia, for tr research agents.

```
The present invention relates to the isolation of human G-protein chemokine receptor, HDGNR10 (CCRS receptor), and the polynucleotide sequence acquence encoding it. HDGNR10 polypeptide and the polynucleotide sequences are or useful for diagnoshing a disease or a susceptibility to a disease or classes of the polynucleotide sequences are or useful for identifying modulators for stimulating haematopoiesis, wound healing, coagulation, angiogenesis, to treat solid tumours, chronic infections, leukaemia, Tocall mediated autoimmune diseases, parasitic infections, psoriasis, or preventing and/or treating allergy, atherogenesis, anaphylaxis, preventing and/or treating allergy, atherogenesis, anaphylaxis, malignancy, chronic and acute inflammation, histamine and immunoglobulin E (IgE)-mediated allergic reactions, protaglandin-independent fever, bone marrow failure, sarcoidosis, rheumatoid arthritis, shock and hyperessinophilic syndrome. Polynucleotide sequences encoding HDGNR10 can be used in gnee therapy to treat conditions related to underexpression of HDGNR10. The present sequence represents human G-protein chemokine
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   100.0%; Score 96; DB 5; Length 352; 100.0%; Pred. WO200264612-A2.

22-AUG-2002.

Roschke V, Rosen CA, Ruben SM;

WPI; 2002-643455/69. N-PSDB; ABS68553. New human G-protein Chemokine Receptor gene (HDGNR10) useful for treating, preventing, ameliorating or monitoring diseases or disorders associated with aberrant expression of HDGNR10 e.g. cancer.

Disclosure, Fig 1A-B; 562pp; English.

The invention describes an isolated polynucleotide encoding a first antibody at least 95-100% identical to a second antibody consisting of antibody at least 95-100% identical to a second antibody consisting of a maino acid sequence comprising at least one, two or three CDR regions of a variable heavy (VH) or variable light (VL) domain of the antibody conversed by a hybridoma cell line consisting of XB3.5F1, XF11.1F8, CC XF2.3C2, XF2.1G2, XF2.7C8.7D5, XF2.7C8.1D5, XF2.7

```
The invention relates to human G-protein chemokine receptor (CCR5), HDGNR10 proteins and nucleic acid molecules encoding such proteins. CCR5 antibodies are used for the treatment or prevention of inflammation, defective or aberrant chemotaxis of immune cells or T cell antigenpresenting cell interaction, viral infections (specifically human immune deficiency (including its early stages), cytomegalo or pox viruses), autoimmune disease, rheumatoid arthritis, neurodegeneration, Pneumocystis carinii infection, Kaposi's sarcoma or any condition associated with deberrant expression of CCR5 or their ligands. They are also used for the detection, diagnosis, prognosis and monitoring of cancers or other hyperproliferative diseases. The present sequence is human G-protein chemokine receptor (CCR5), HDGNR10 DNA
protein chemokine receptor (CCRS) HDGNR10. This is an amino acid sequence of Human G-protein chemokine receptor (CCRS) HDGNR10 #1
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   New nucleic acid encoding antibodies to the human CCR5 receptor HDGNR10, useful for treatment, prevention and diagnosis of e.g. cancer, also related antibodies.
                                                                                                                                                                                                                                                                                                                                                                                                  Human; G-protein chemokine receptor; CCRS; HDGNR10 protein; cancer;
